1. Titel

Pet-Care Connect: A Platform for Integrated Veterinary Care, Medication Management, and Comprehensive Pet Solutions

2. Introduction

The global pet care industry is currently facing a critical need for an integrated and accessible platform that combines diverse services under a single, trustworthy umbrella. While pet ownership is flourishing, the existing ecosystem for pet care remains fragmented, forcing owners to navigate multiple providers for services ranging from routine care to specialized medical treatments. This lack of a centralized system creates significant challenges in managing pet health, including difficulty in accessing prompt veterinary care, administering medications correctly, and finding reliable support for emergency situations and specialized needs.

Traditional pet care methods, such as using disparate clinics, individual pet sitters, and separate emergency services, are often inefficient and lack the seamless flow of information necessary for optimal care. This can be particularly problematic in cases of illness or injury, where the continuity of care between regular check-ups, emergency visits, and post-operative follow-ups is essential. The manual coordination of these services is prone to error and can lead to delayed or inadequate treatment, especially for helpless or critical animals.

The proposed Pet-Care Connect platform leverages advancements in artificial intelligence (AI) and machine learning (ML) to bridge these gaps. This innovative solution will not only streamline essential services but will also provide a robust framework for managing complex pet health needs. By integrating features such as veterinary channeling, medication and treatment tracking, and surgical scheduling, the platform transforms the pet care experience into a cohesive and proactive system. Furthermore, it will include services often found in a full-service pet hospital, such as

animal adoption, boarding and warding, and mobile services for emergency and critical care. This holistic approach will ensure that pet owners can access comprehensive support, from routine check-ups and common problem solutions to emergency interventions and long-term care for their companions.

The development of this platform is rooted in the vision of creating an all-encompassing digital ecosystem that serves the entire pet community—owners, veterinarians, and animal shelters alike. The system will automate key processes, such as appointment scheduling and medical record transfers, while providing tools for remote monitoring and consultation. Ultimately, Pet-Care Connect is designed to improve the quality of life for pets by offering a single point of contact for all their needs, ensuring they receive the best possible care, especially in critical moments.

3. Current situation leading to problem identification

The current pet care ecosystem, while extensive, is characterized by significant challenges that impede effective and equitable access to care. These issues are multifaceted, encompassing logistical, financial, and technological barriers that impact pet owners, caregivers, and veterinary professionals alike.

I. Challenges in Timely and Equitable Access to Veterinary Care

The existing system often fails to provide prompt and consistent care, particularly in non-urban areas or for specialized needs.

Delays in Veterinary Consultations: Pet owners frequently face long waiting times for appointments, especially for non-critical conditions. This can delay diagnosis and treatment, potentially worsening a pet's health condition.

Subtlety of Diagnosis: Many pet health issues, such as early-stage illnesses or subtle behavioral changes, are difficult for owners to recognize and describe accurately. Without professional guidance, these issues can be overlooked, leading to more complex and difficult-to-treat problems later on.

Emergency and Critical Care Gaps: While emergency services exist, a lack of seamless integration with a pet's regular medical history can lead to fragmented care. The absence of a mobile and on-demand critical care service further compounds this issue, especially in remote or underserved areas.
(American College of Veterinary Emergency & Critical Care, 2025)

II. Gaps in Public Knowledge and Support

Pet owners often lack the necessary knowledge and tools to manage their pet's health proactively.

Limited Pet Health Literacy: The average pet owner may not be able to correctly identify the early warning signs of common diseases or behavioral issues. They often rely on generic, unverified online information, which can lead to misdiagnosis or inappropriate at-home treatments.

Excessive Use of Self-Diagnosis: Many owners attempt to diagnose their pets' conditions using internet searches or social media, which often leads to misinformation. This can cause unnecessary anxiety, inappropriate interventions, or a false sense of security, delaying a proper professional consultation.

Lack of Guidance: There is a significant need for a reliable, expert-curated source of information for routine queries related to pet nutrition, behavior, and general wellness. Owners often struggle to find trustworthy advice, leading to poor management of their pet's daily care.

(Antonio, 2012)

III. Inequality in Access to Comprehensive Care

Access to quality pet care is disproportionately affected by socioeconomic and geographic factors.

Geographic and Economic Barriers: Pet owners in rural or remote areas have limited access to veterinary clinics and specialized services. The cost of travel and consultation fees can also be prohibitive, creating a barrier to care for low-income populations.

Digital Divide: Not all pet owners have access to digital tools or the technical proficiency required to use complex health-related applications. Existing solutions may not be user-friendly, exacerbating this divide and excluding a significant portion of the pet-owning population.
(Ng, 2022)

IV. Technology Gaps in Existing Solutions

While some technological solutions exist, they are often limited in scope and fail to provide a holistic approach.

Narrow Diagnostic Range: Most current applications that use AI for pet health are limited to diagnosing a very narrow range of common conditions, failing to provide comprehensive support for more serious or complex issues.

Poor Usability and Integration: Existing platforms often lack a user-friendly interface or fail to integrate essential services. Pet owners may still need to use separate apps for veterinary channeling, pet sitting, and medication management, negating the benefits of a centralized platform.

Lack of Comprehensive Support: Current solutions rarely offer features like medication management, surgical scheduling, or access to critical care services, leaving significant gaps in the continuum of care. The absence of a secure medical record system further prevents a cohesive approach to a pet's health journey
(Farhat, 2021)

4. Proposed technique to solve the current problem

This project proposes a web-based, AI-driven platform to provide a fast, accessible, and comprehensive solution to the challenges in the pet care ecosystem. It will offer a single, integrated hub for all pet-related needs, leveraging artificial intelligence and expert consultation to ensure the well-being of animals.

I. AI-Based Symptom Recognition and Problem Solution

The core of the system will utilize a machine learning model, primarily powered by Convolutional Neural Networks (CNNs), trained on a diverse dataset of pet health images and textual data. This will enable the platform to provide actionable advice and preliminary diagnoses.

- **Real-time Symptom Analysis**: Users will be able to upload images or videos of their pet's affected areas, such as a rash or a wound. The AI model will analyze these inputs and provide a probable diagnosis with a confidence level. It will also offer side-by-side visual comparisons to help users understand the issue.

- **Disease Information & Treatment Recommendations**: For a given condition, the system will provide detailed information on its causes, symptoms, and risk factors. It will also suggest medically appropriate treatment recommendations, such as over-the-counter remedies or home care, and advise when to seek professional veterinary help.

- **Preventive Care & Lifestyle Advice**: The application will offer tailored suggestions for preventive care, including dietary habits and regular exercise, to minimize future health problems based on the pet's specific breed, age, and history.

II. User-Friendly Web Interface and Interactive Tools

Ease of use and accessibility will be a top priority for all users, regardless of their technical proficiency. The interface will be intuitive and designed for a seamless experience.

- **Simple Image Upload & Diagnosis**: The process for diagnosis will be simplified to a drag-and-drop or mobile camera upload. The system will then scan the image and present the diagnosis in a clear and easy-to-understand format.

- **Educational Portal**: A rich repository of information will be available, including articles, infographics, and videos on common pet conditions, nutritional advice, and behavioral training tips. This will help debunk common myths and improve pet health literacy.
- **Chatbot Support**: An AI-powered chatbot will be integrated to guide users through the platform, answer common questions, and provide immediate support.

III. Customized User Experience with Medical History and Visual Tracking

The platform will allow sustained user interaction and the tracking of a pet's health over time.

- **User Profiles and History**: Each user will have a dedicated profile for their pet where they can store and track past diagnoses, treatment responses, and medical records. This creates a centralized, easily accessible health history.

- **Pet Demographics Adaptation**: The AI model will be adapted to function effectively with different pet breeds, ages, and genders, ensuring accurate and unbiased results for all users.

- **Secure Medical Record System**: The platform will serve as a secure medical record system, allowing for seamless sharing of information between the owner and various veterinary professionals, ensuring continuity of care.

IV. Integration of Expert Consultation and Feedback

To build credibility and trust, the platform will offer a hybrid solution that combines the speed of AI with the expertise of licensed professionals.

- **Ask an Expert Feature**: Users will be able to submit questions or cases that require human review. These cases will be sent to a network of licensed professionals who will provide tailored feedback within a defined timeframe.

- **Storage of Responses and Recommendations**: All expert feedback and recommendations will be saved directly to the user's account for future reference. This creates a valuable, personalized health history and enhances the platform's accuracy over time.

5. Feasibility Study

The feasibility study examines whether the proposed Pet-Care Connect platform can be successfully developed and implemented under current technological, financial, and operational conditions. The study confirms that the project is not only technically viable but also financially and operationally sustainable.

I. Financial Feasibility

The development of the platform will be cost-effective and sustainable in the long run.

- **Cost-Effective Development:** The project will utilize a range of open-source technologies, such as Python, TensorFlow, and web frameworks like Streamlet. This approach significantly reduces the need for expensive software licenses and proprietary tools for model training and deployment, lowering overall development costs.

- **Long-Term Economic Benefits**: The platform will generate substantial cost savings for users by reducing unnecessary veterinary visits for non-critical issues. By enabling early diagnosis and intervention, it can prevent minor problems from escalating into costly and complex treatments. This also reduces the workload on veterinary professionals, improving the efficiency of the healthcare system.

- **Projected Savings**: By providing a reliable source for preliminary diagnostics and home care advice, the system will save users money on unnecessary clinical visits and reduce the overall burden on the veterinary healthcare system. These long-term savings contribute to the economic feasibility of the project.

II. Technical Feasibility

The technical components required to build and operate the platform are mature and readily available.

- Proven Technology: The proposed system relies on a Convolutional Neural Network (CNN), a proven and highly successful model for image classification. This technology is widely used in medical diagnostics, making it a reliable choice for the platform's core diagnostic function. The model can be developed using established libraries like TensorFlow and Keras in a stable environment like Jupyter Notebook.

- Available Resources: The AI model can be trained on a massive amount of high-quality, open-source pet health images and data from platforms like Kaggle. For data handling, robust databases like SQLite can be used to securely and efficiently store user data, medical history, and diagnostic information.

- User-Friendly Integration: The Streamlit framework provides a way to quickly integrate the machine learning model into a functional, user-friendly web application, enabling rapid prototyping and deployment without extensive web development overhead.

III. Operational Feasibility.

The platform is designed for high accessibility and ease of management, ensuring a smooth operational workflow.

- **Ease of Integration**: The system is designed to be user-friendly for non-technical users. Its clean web-based interface allows users to easily upload images and get immediate, actionable advice. The platform is also compatible with existing digital infrastructure, requiring minimal

installation or technical skills from the user, which will encourage high adoption.

- **Operational Support:** The system can be deployed on cloud platforms such as Heroku or Firebase, which eliminates the need for large-scale physical infrastructure. The cloud-based nature ensures the platform is accessible anywhere with an internet connection.

- **Minimal Technical Support**: The intuitive, self-service nature of the platform means it will require minimal technical support, ensuring it is scalable for long-term use and expansion.

IV. Legal Feasibility

The project acknowledges and addresses the legal and ethical considerations associated with handling sensitive user data.

- **Data Privacy**: The platform will collect sensitive user information, including health data and images. Therefore, it will adhere to strict data privacy regulations such as the General Data Protection Regulation (GDPR) and the California Consumer Privacy Act (CCPA).

- **Data Security**: The platform will implement encryption and robust user consent mechanisms to ensure all data is handled responsibly and legally. Secure storage protocols will be in place to protect user information from unauthorized access.

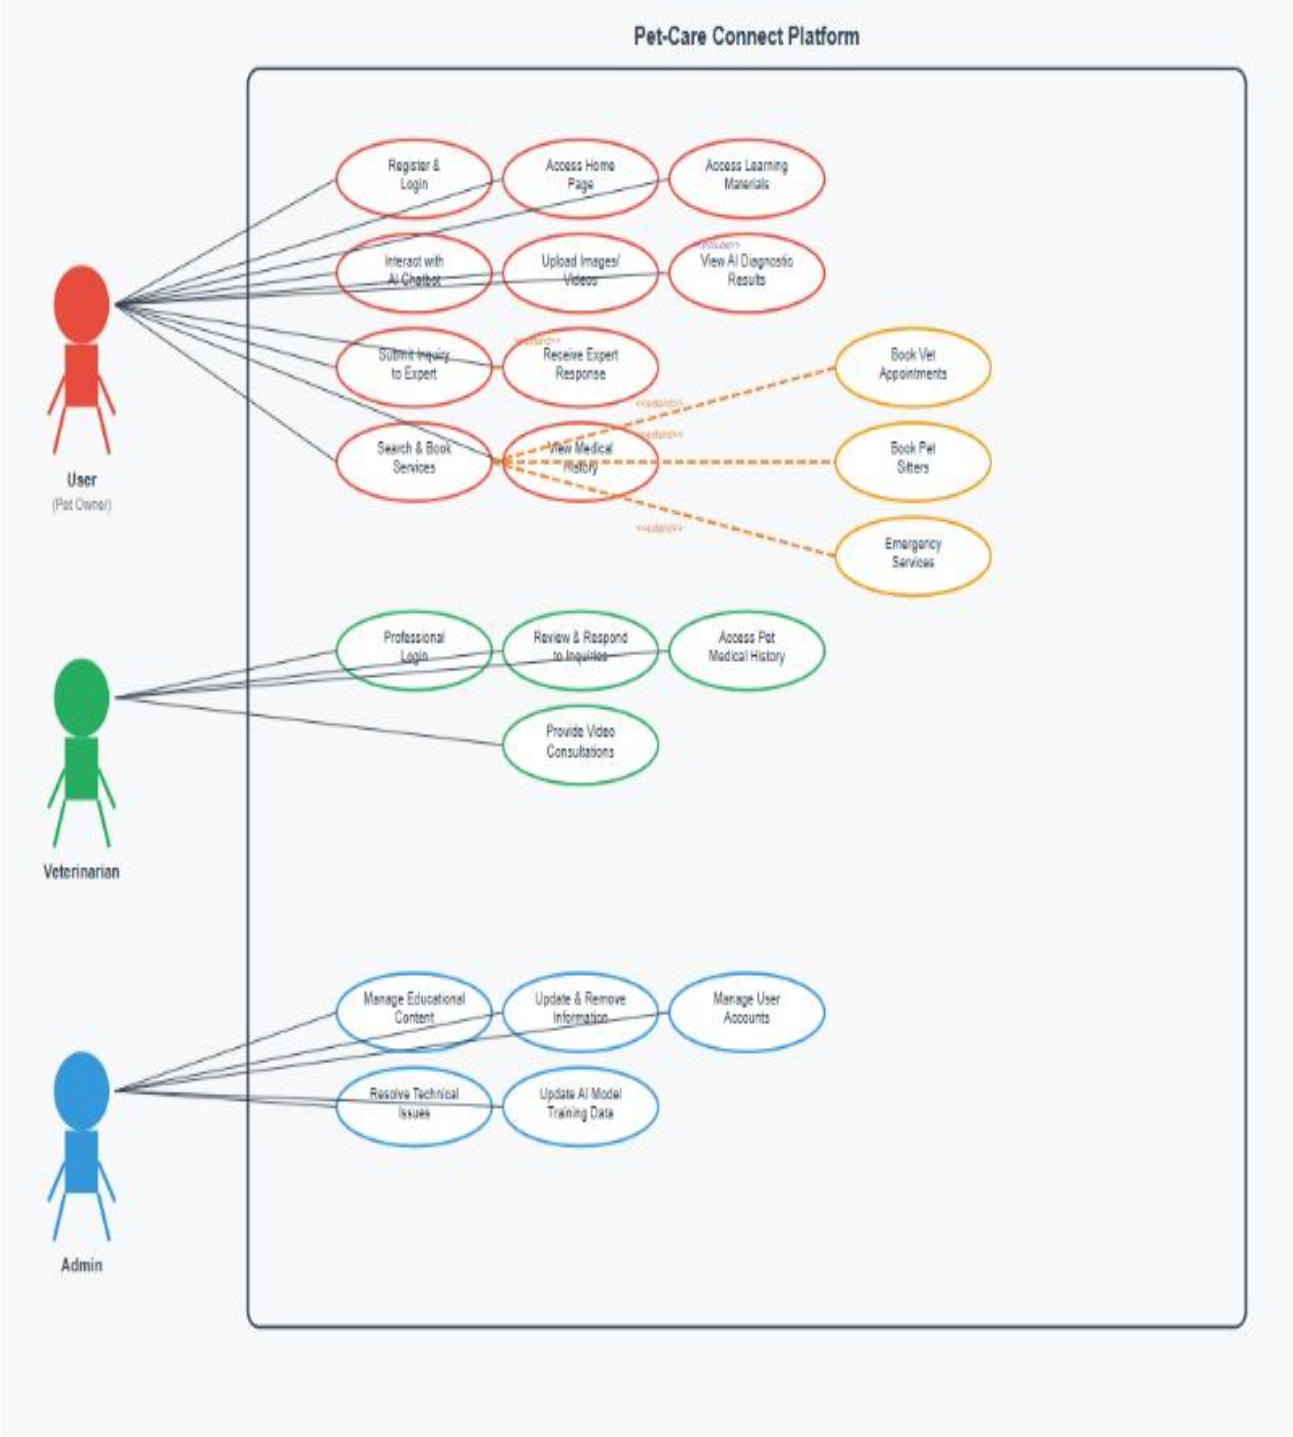
- **Intellectual Property**: All equipment, libraries (e.g., TensorFlow), and databases (e.g., SQLite) used in the project are open-source and will be used under their proper licensing terms. The system will comply with all licensing agreements for its datasets and codebase to prevent legal conflicts and ensure permanent use.

6. Project Description

The project involves the design, development, and deployment of a web-based application titled "Pet-Care Connect: A Platform for Integrated Veterinary Care, Medication Management, and Comprehensive Pet Solutions." The platform combines an AI-powered diagnostic system with robust features for veterinary channeling, medication tracking, and a comprehensive educational portal. The system is designed to improve the transparency, efficiency, and accessibility of pet care by providing expert support and learning opportunities for pet owners and professionals.

The system's primary objective is to create a unified digital ecosystem that addresses the fragmented nature of the current pet care industry. By integrating multiple services—from preliminary AI diagnostics and expert consultations to pet sitting and emergency services—the platform provides a holistic solution for managing a pet's health and well-being. It is intended to serve a wide range of users, including pet owners, veterinary professionals, and administrative staff at clinics and shelters.

Use Case Diagram



This diagram organizes and visualizes the system's behavior, placing strong emphasis on providing accessible, real-time support and user education. It highlights the integration of an AI-powered solution with professional medical oversight, ensuring a continuous improvement process through administrative controls.

The diagram also features key UML relationships such as

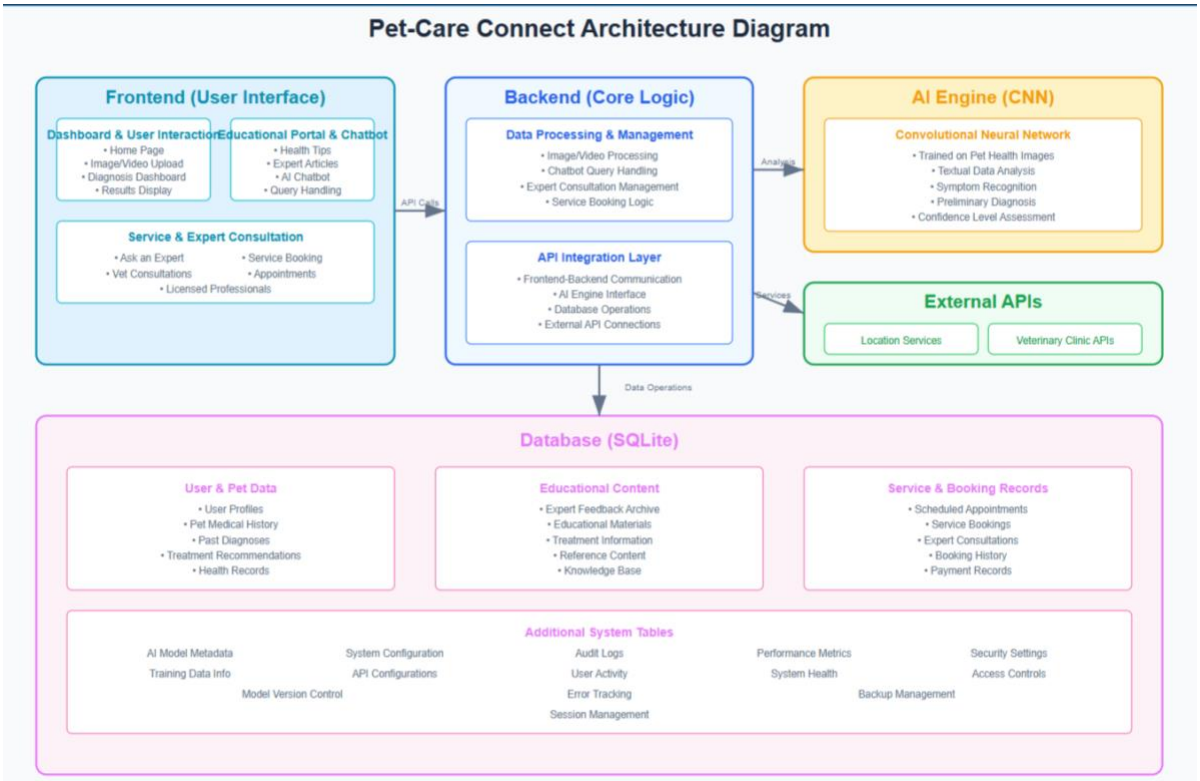
<<extend>> and <<include>> to detail the flow of specific actions.

<<extend>> & <<include>>:

<<extend>>: For example, "Submitting an inquiry" <<extends>> "Receiving expert responses," meaning the second action is a conditional extension of the first.

<<include>>: For example, "Uploading an image" <<includes>> "Viewing disease results," as the first action is a necessary part of the second.

Architecture Diagram



This architecture diagram illustrates the "Pet-Care Connect" web application, designed to provide an integrated platform for pet care. The system leverages AI to assist users with preliminary diagnoses, offers access to educational content, and facilitates consultations with veterinary experts.

Frontend

The user interface consists of key modules that enable comprehensive pet care management.

- Dashboard and User Interaction: The home page, image/video upload portal, and diagnosis dashboard allow for user interaction, real-time symptom analysis, and results display.
- Educational Portal and Chatbot: These components provide users with expert-curated pet health tips, articles, and automated query handling.

- Service and Expert Consultation: The "Ask an Expert" and "Service Booking" options allow users to schedule consultations, appointments, or other services with licensed professionals and providers.

Backend

The backend processes uploaded images, handles chatbot queries, and manages all expert consultations and service bookings. It serves as the core logic layer, connecting the frontend with the database and APIs.

- AI Engine (CNN): The core of the system uses a Convolutional Neural Network (CNN) model. It is trained on a large dataset of pet health images and textual data to analyze user-uploaded content, recognize symptoms, and provide preliminary diagnoses with a confidence level.
- External APIs: Integration with APIs allows for additional functionalities, such as location services for finding nearby veterinary clinics or other pet-related businesses.

Database (SQLite)

The database stores all critical information for the platform.

- User and Pet Data: Stores user profiles and a pet's medical history, including past diagnoses, treatment recommendations, and records.
- Educational Content: Archives expert feedback, educational materials, and treatment information for reference and reuse.
- Service and Booking Records: Keeps a record of all scheduled appointments and services.

7. Deliverables

For the "Pet-Care Connect" project, the Agile Kanban model is the most suitable SDLC approach. This model promotes flexibility and ensures continuous progress by imposing functions, limiting the work-in-progress, and immediately integrating the user response. The visual workflow of the agile kanban supports recurring improvements, which promotes regular feedback loops and enhances incremental growth in the entire project life cycle.

Agile Kanban Approach

The development of the "Pet-Care Connect" platform follows the agile kanban model, which breaks the work into manageable tasks imagined on the Kanban Board. Each stage needs to be worked on from gathering to maintenance after deployment-repetition and incremental, allowing the team to react faster and develop the user needs.

i. Requirement Gathering

Process:

- Identify all essential functionalities for the Pet-Care Connect system, including core characteristics such as image uploads using AI, detection of diseases, displaying diagnosis results, and offering support resources for users.
- Prioritize works based on importance and dependence. Major features such as AI-based diagnosis are given top priority.

Outcome:

- A clearly defined and prioritized backlog to ensure that critical features are developed first.
- Detailed documentation of system requirements and user requirements to guide the project phase.

ii. System Design

Process:

- Collect a broad dataset of pet images representing various diseases and healthy skin conditions to train AI models.
- Design a scalable system architecture that combines the front-end interface with back-end processing (including the AI engine and database).
- Define interactions between components such as the AI model, user interface, and data storage.

Outcome:

- A curated and labeled image dataset prepared for AI training.
- A modular system architecture seamless components ensure integration and future scalability.
- The Kanban board was used to track design and data preparation tasks.

iii. Implementation

Process:

- Develop an AI model using machine learning algorithms capable of analyzing pet images and diagnosing diseases based on visual features.
- Create a user-friendly web interface for users to upload images, achieve results, and access relevant health information.
- To handle the image upload, apply back-end functionality to handle the AI model and store user interaction data.

Outcome:

- Diagnose trained and valid AI models to improve accuracy.
- Iteratively developed front-end and back-end components, with continuous integration of features.
- The functional module was tested when the design requirements were met.

iv. Tests

Process:

- Integrate the front-end, back-end, and AI module in a complete system.
- Conduct systematic tests to ensure component differences and optimal performance.
- Collect a response from initial users to identify issues and improve purpose and accuracy.

Outcome:

- The fully integrated system with all components functioning cohesively.
- The recognized bug and performance issues were addressed quickly.
- To increase the accuracy of the user experience and diagnosis, the system was fine-tuned based on real user feedback.

v. Deployment, Documentation, and Final Preparation

Process:

- Prepare complete documentation, including a user manual and technical documentation for system maintenance.
- To support real-time image processing, deploy the application on the cloud server and ensure 24/7 availability.
- Conduct final deployment checks and prepare onboarding resources for users.

Outcome:

- A live, fully operating web application is available to users.
- All documents provided for users and system administrators.
- Cloud deployment ensures scalability and reliability.

8. Resources Required

The "Pet-Care Connect" project requires a combination of software, hardware, and human resources to successfully develop and deploy the integrated platform. The following is a detailed breakdown of the resources needed.

- **Software Resources**
  - **Visual Studio Code (VS Code):** This serves as the primary Integrated Development Environment (IDE) for frontend and backend development. It offers features like rich support for Python syntax, debugging, and linting, as well as integration with Git for version control.
  - **Streamlit**: This framework is essential for rapid prototyping of the web application. It simplifies the integration of the machine learning model into a user-friendly web interface, allowing for quick deployment of the user dashboard, image upload functionality, and dynamic content.
  - **Jupyter Notebook**: This is the tool used for machine learning model development and experimentation. It provides an interactive environment for writing code, visualizing data, and fine-tuning the AI model's hyperparameters.
  - **TensorFlow and Keras**: These are the core frameworks used to build and train the Convolutional Neural Network (CNN). They provide a high-level API for easy model construction and advanced tools for deep learning algorithms, enabling the AI to accurately classify pet health images.
  - **SQLite**: A lightweight, serverless relational database used for storing and managing user data. It's a key component for storing pet medical history, diagnostic information, and service records.
  - **Python**: The main programming language used for the backend logic and machine learning components. It supports a wide range of libraries for data handling, model execution, and web interactions.

- **Hardware Resources**
  - **Development Machines**: The development team will use standard machines with Intel i5 processors or higher, 8GB RAM, and 256GB SSD storage. These specifications are sufficient for coding, model training, and testing using Jupyter Notebooks and VS Code.
  - **Deployment Server**: The live application will be hosted on a cloud-based server from providers like AWS, Heroku, or PythonAnywhere. It requires at least 4GB RAM and a dual-core CPU to run the web interface, handle database operations, and serve users in real time.
- **Human Resources**
  - **Software Developers**: They are responsible for designing the backend logic, frontend interface, and integrating the database. Key skills required include proficiency in Python, SQL, and Streamlit.
  - **Machine Learning Engineers / Data Scientists**: Their role is to develop, train, validate, and deploy the CNN-based image classification model. They need expertise in deep learning, image preprocessing, and frameworks like TensorFlow and Keras.
  - **UI/UX Designers**: They will create intuitive and user-friendly interfaces that prioritize accessibility and visual appeal. Required skills include user interface design principles, usability testing, and frontend prototyping.
  - **Testing & QA Team**: This team conducts functional, integration, and usability tests to ensure the system is bug-free and meets user requirements.
- **Additional Resources**
  - **Internet Access**: Necessary for downloading tools, accessing datasets, and deploying the application on cloud servers.
  - **Documentation Tools**: Software like Microsoft Word is used to prepare technical and user documentation, manuals, and system reports.
  - **Version Control**: Git and GitHub are used for collaborative development, code versioning, and team coordination.
  - **Kaggle**: This platform serves as a primary data source, providing publicly available datasets of pet health images for training the AI model.

9. Expected Output and Outcome

The "Pet-Care Connect" platform is designed to produce tangible, measurable outputs and significant, positive outcomes that will benefit both pet owners and the broader veterinary healthcare ecosystem.

i. Expected Output

The project will deliver a fully functional, web-based application with a range of key features.

- **Functional Web-Based AI Application**: A responsive web application where users can upload pet images and receive immediate, AI-powered preliminary diagnoses of common pet conditions using a Convolutional Neural Network (CNN). The output will include a probable diagnosis with a confidence percentage and relevant visual comparisons to help the user understand the findings.
- **Real-Time Treatment Suggestions**: The system will provide automatic recommendations for basic treatment options and self-care tips. It will also offer a clear indication of when a condition requires immediate professional consultation from a veterinarian.
- **Educational Content Hub**: A comprehensive, multimedia library with articles, videos, and infographics on various pet conditions, preventive care, nutrition, and behavioral training. This content will be expertly curated and updated regularly.
- **Personalized User Profiles**: Secure user accounts will store each pet's medical history, including past diagnoses, treatment outcomes, and personalized care recommendations. A visual tracking dashboard will allow users to monitor their pet's condition over time.

ii. Expected Outcome

The successful implementation of the "Pet-Care Connect" platform is projected to bring about several impactful and transformative changes to the pet care industry.

- **Improved Early Diagnosis and Intervention:** A significant reduction in the time it takes to identify a pet's health conditions, enabling earlier treatment and better outcomes. The increased accessibility of the tool will lead to greater accuracy and consistency in preliminary diagnoses, especially for pet owners in rural or underserved areas who may not have immediate access to a vet.
- **Reduced Healthcare Burden**: By providing a reliable source for preliminary diagnostics and home care advice, the system will decrease the number of unnecessary veterinary visits for non-critical issues. This will help to alleviate stress on veterinary healthcare systems, allowing professionals to focus on more serious and complex cases.
- **Enhanced Public Awareness and Self-Care**: Users will become more informed about pet health, leading to improved daily care and preventive practices. The platform's expert-reviewed educational content will reduce the spread of misinformation from unverified online sources, empowering pet owners to take a more proactive role in their pets' well-being.
- **Greater Equity in Veterinary Care**: The platform will serve as an accessible and scalable solution for marginalized communities with limited healthcare access. Its user-friendly design and remote capabilities will help bridge the digital and geographic divides, making quality pet care resources available to a broader audience.
- **Empowerment through Technology**: The project will empower individuals to take control of their pet's health through AI-driven tools, promoting digital health transformation and setting a foundation for future advancements in AI-based medical tools for both animals and humans.
- **Research and Continuous Learning**: The platform will facilitate the ethical collection of anonymized user data (with user consent), which can

be used to continuously improve the accuracy of the AI models over time. It also offers a significant potential for collaboration with veterinary research institutions to further advance pet health and wellness.

10. Time Plan for Implementation

Phase	Tasks	Duration
Requirement Analysis	Identify user needs, define functional and non-functional requirements, and create a prioritized product backlog.	5 Days
System Design	Collect datasets (pet health images), design the system architecture, and define the Al model and Ul structure.	10 Days
Implementation	Develop the Al model (training/testing), build the web interface and backend APIs, and integrate the frontend and Al services.	35 Days
Testing	Conduct system integration testing, gather user feedback, and perform bug fixes.	15 Days
Deployment	Prepare documentation, deploy the system to a hosting server, and perform final system checks.	7 Days

Maintenance	Monitor system usage. Fix bugs, retrain model with new data Release system updates	Post-Deployment (Ongoing)

11. Limitations

The development and deployment of the "Pet-Care Connect" platform are subject to several inherent limitations and potential obstacles that must be considered to ensure a successful and sustainable solution.

- **Limited and Unbalanced Dataset**: The accuracy and effectiveness of the AI model are directly tied to the availability and quality of the training data. The model is trained on open-source pet health image datasets from platforms like Kaggle, which may not be comprehensive enough to cover all rare diseases or be balanced across different breeds, ages, and genders of animals.

- **Variable User-Submitted Image Quality**: Since the primary method of diagnosis relies on user-uploaded images and videos, the performance of the AI model can be significantly impacted by poor image quality, such as blurry, poorly lit, or unfocused images. These variations can lead to delays or inaccurate preliminary diagnoses.

- **Internet Dependence**: As a web-based platform, the system's performance is entirely dependent on the user's internet connection. Slow or unstable connections may result in delays or unsuccessful image uploads and can affect real-time interaction with the chatbot.

- **Third-Party Dependencies**: The project relies on various open-source tools and cloud services, including TensorFlow, Streamlit, SQLite, and cloud hosting platforms like Heroku or Firebase. Any outages, changes in legal requirements, or

disruptions in these services could impact the platform's development, deployment, and ongoing operation.

- **Legal and Ethical Obstacles**: The platform collects sensitive information, including pet health data and images, which must adhere to strict data privacy regulations like GDPR and CCPA. Changes in these legal frameworks could affect the system's functionality and necessitate updates to this data handling and security Protocols.
